

How to install the Spring Tool Suite (STS)

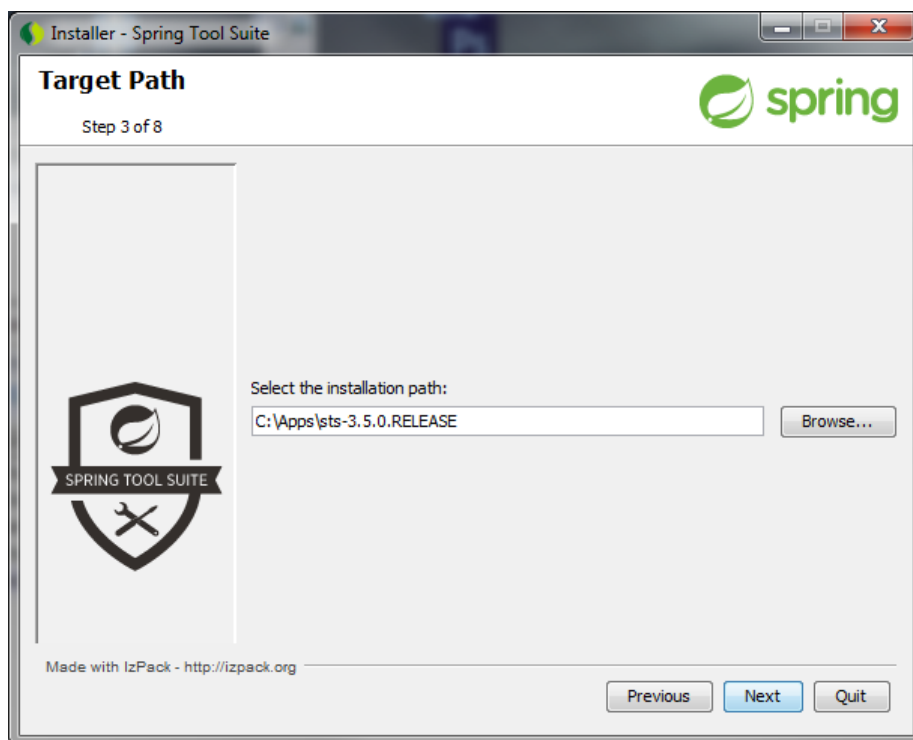

1

Make sure you already installed the current version of [JDK](#). Next, go to <http://spring.io/tools/sts/all> and choose the **newest version of Eclipse**. Select the **exe** or **dmg** installation file which **matches** your computer's **operating system**.

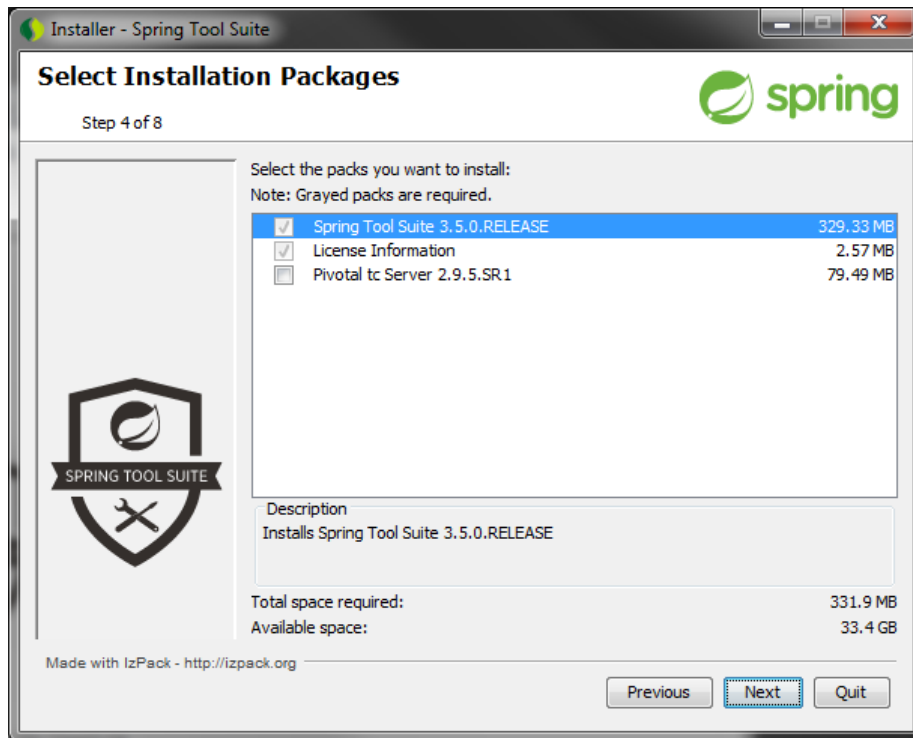

2

Execute the file and follow the **installation process**. Choose a target path for the installation (e.g., C:\Apps\sts-3.5.0.RELEASE).

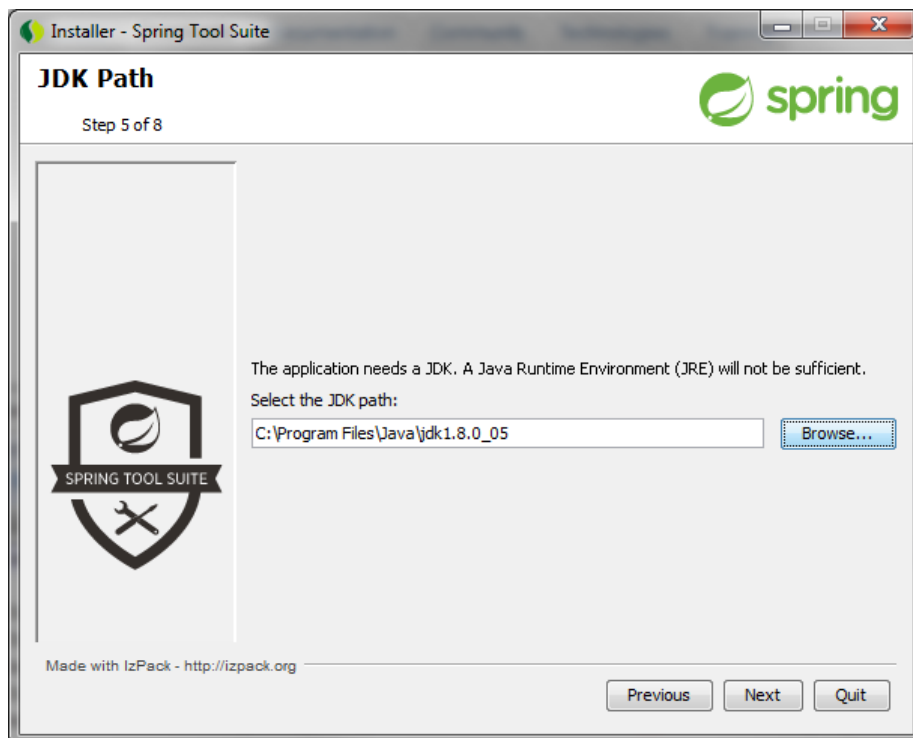

3

Next, you have to **select the packages** you want to install. You do **not** need the **Pivotal tc Server** to work with Tatool.

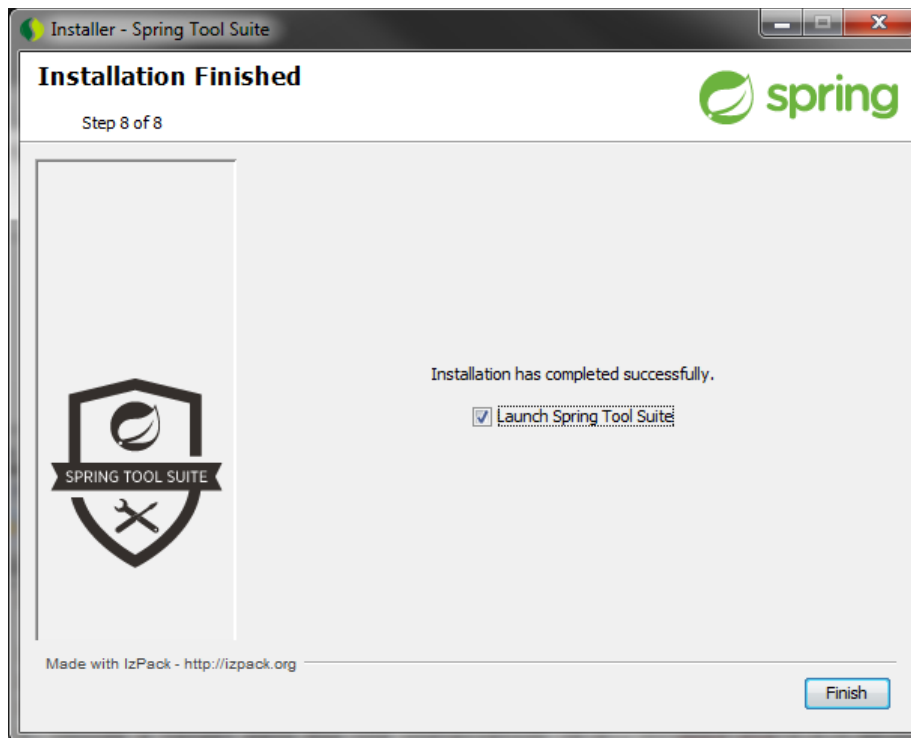

4

You will next be asked to select the **location of your JDK**. In case you have multiple JDKs installed, we recommend selecting the newest version.

5

Complete the remainder of the installation process and launch the STS.

6

Choose a **workspace**. This is the folder in which your projects and settings will be saved. If you do not want to work with different workspaces (applies for most users), select "**Use this as the default and do not ask again**". Click "OK" - you are now ready to import the Tatool Examples Project.
